

FOSE1025 — Scientific Computing

Week 9 Lecture 1: Ethics and Reproducibility

Diego Mollá

Department of Computer Science
Macquarie University

FOSE1025 2020H1

Programme

- 1 Ethics
- 2 Reproducibility

Reading

- Lecture notes

Programme

- 1 Ethics
 - Ethics in Science
 - Ethical Concerns with Data
- 2 Reproducibility

Ethics in Life

<https://www.scu.edu/mobi/resources-tools/blog-posts/ethics-in-life-and-business/ethics-in-life-and-business.html>

Academic Integrity at Macquarie University

But What is Ethics?

<https://www.dictionary.com>

ethical [eth-i-kuhl] [SHOW IPA](#) 

[SEE SYNONYMS FOR ethical ON THESAURUS.COM](#)

adjective

- 1 pertaining to or dealing with morals or the principles of morality; pertaining to right and wrong in conduct.
- 2 being in accordance with the rules or standards for right conduct or practice, especially the standards of a profession:
It was not considered ethical for physicians to advertise.
- 3 (of drugs) sold only upon medical prescription.

Key Ethical Issues with Scientific Research

Data Fabrication: Create or manipulate data to fit someone's purpose.

Plagiarism: Pretend that someone else's ideas are ours. Not acknowledging the source.

Impact in Society: Fail to consider the possibly negative impact of one's research.

Data Fabrication: The Case of Diederik Stapel

- <https://www.apa.org/science/about/psa/2011/12/diederik-stapel>
- Diederik Stapel was a social psychologist.
- He was involved in multiple cases of data fabrication.
- He manipulated data and fabricated entire experiments.
- It took several years to uncover the fraud because of several reasons:
 - The prestige of the researcher.
 - Insufficient clarity in the manuscripts as to how the data were collected.
 - Data used in the experiments were not made available.
 - As was usually the case in the field.

Different Forms of Fabricating Data

Besides the obvious fraud of creating data that does not exist, sometimes there is a fine line between fraud and poor research. For example:

- Manipulate the data so that it fits our expectations.
- Cherrypicking samples from our data.

<https://freshspectrum.com/toon-cherry-picking-data/>

This is not data analysis...

Plagiarism

- An essential part of science is to advance work made by others.

“If I have seen further than others, it is by standing upon the shoulders of giants”
(Isaac Newton)

- ... but the work by others needs to be acknowledged.
- Failing to acknowledge others' work can be plagiarism.
- Self-plagiarism is also plagiarism.

Impact in Society

- A common ethical problem with research and development in science and technology is not to stop and consider its possible (negative) impact in society.
- This is easier said than done. Often the implications of research in society are only known after the damage is done.
- Not everything is black and white: the impact can be both positive and negative.
- But stopping and thinking about these impacts can help improve the positive impact and diminish the negative impact.

(Alfred Nobel)

Key Ethical Issues with Data

<https://www.linkedin.com/learning/people-analytics/ethical-considerations>

Privacy: Make sure that private data keeps private.

Security: Protect your data, avoid unauthorised access.

Fairness: Avoid bias in data, avoid promoting bias when using the data.

Disclosure: The users who provided the data need to know what you are using the data for.

Privacy

- When data are collected from people, it needs to be **anonymised**.
- In anonymised data, references to private information are deleted or modified.
 - Names
 - Addresses
 - Passport numbers
 - ...
- Currently there's so much data publicly available that it becomes possible to identify users and their habits even when the data have been anonymised.
 - De-anonymisation

Security

- When gathering data with personal information, keep it secure.
 - Do not make it publicly available.
 - You may need to add password protection.
- Some organisations legislate **where** you can save the data.
 - When saving private data in the cloud, check the data policies of your provider.

<https://www.flickr.com/photos/111692634@N04/15855653380>

Fairness

- When data are collected it might be **biased**.
- That means that the data does not represent the real situation.
- E.g. collecting data from Twitter and assuming that Twitter users represent the entire population.
 - Only some kind of people use Twitter.
- Use of biased data might lead to:
 - Wrong business decisions (and lose money).
 - Perceived bias or racism (and face a lawsuit).

<https://www.independent.co.uk/life-style/gadgets-and-tech/news/bing-image-search-microsoft-jews-racist-hitler-nazis-a8579596.html>

Consent of Data

<https://www.linkedin.com/learning/data-fluency-exploring-and-describing-data/data-ethics>

Regulations like GDPR (Europe — General Data Protection Regulation) and APP (Australian Privacy Principles) establish the need for consent when gathering data.

- **Consent:** When collecting data from people, consent from these people is needed.
- **Informed consent:** People need to know how the data will be used before they give consent.
 - Data collected for one purpose cannot be re-purposed.
- **Voluntary consent:** People have the choice to give consent or not.

Programme

1 Ethics

2 Reproducibility

- About Reproducibility
- Asking Questions for Help

Why Reproducibility?

- When you conduct science, you need to make sure that others can reproduce what you did.
 - If others can reproduce what you did, then your claims are more likely to be taken as valid.
- When you report a problem, you need to make sure that others can reproduce your error.
 - Otherwise they may not be able to help you or fix the error.
 - It is said that the first step to solve the problem is to be able to formulate the question.

But What is Reproducibility?

- Basically, reproducibility means that someone else should be able to do the same as you did by following your instructions.
- When the experiments are performed with computers, there is some discussion/disagreement about what does “following your instructions” means:
 - 1 I can re-implement what you did after I read your report.
 - 2 I can run the code you wrote.
- The employability modules (“Achiever” and “Communicator”) touch item 1.
- Next week we will touch item 2.

Writing for Reproducibility

<https://abstrusegoose.com/588>

When do I Ask?

- Before asking a question, check if someone has asked it before!
- Know the most popular Q/A forums in your field.
 - For example, <https://stackoverflow.com/> is a very popular forum for asking questions related to programming.
- Know how to search the web for solutions to your problem.
 - If you have a computer error, try a web search using the error message.

Is the Answer Somewhere in iLearn?

- 1 Check in the Announcement sections.
- 2 Check in the FAQ.
- 3 Search the Discussion Forums (e.g. use the search box).

The screenshot shows the iLearn interface for the unit FOSE1025 Scientific Computing. The top navigation bar includes the Macquarie University logo, a 'Help Me' button, the user's name 'Diego Molla-Allod Student', and the iLearn logo. Below the navigation bar, the unit title 'FOSE1025 Scientific Computing' is displayed. A breadcrumb trail shows the path: 'My home / My units / FOSE1025_FHFYR_2020_ALL_U / General / General Discussion Forum'. A search bar is highlighted with a red circle, with the text 'Search forum' next to it. Below the search bar, the 'General Discussion Forum' section is visible, featuring a gear icon and a description: 'Check the General Discussion Forum on a regular basis for weekly communications by your tutor. This forum also allows you to post any questions you might have in relation to this unit.' On the right side, there is an 'Activities' sidebar with a list of links: Assignments, Dialogues, Forums, Quizzes, Resources, and Turnitin V2.

How do I Ask?

From <https://stackoverflow.com/help/how-to-ask>

- Choose the right title.
- Describe your problem.
- Help others reproduce your problem.
- Proof-read before posting.

Choose the Right Title and Description

Choosing the right title

- Pretend you're talking to a busy colleague.
- Try to sum-up your entire question in one sentence.
- Spelling, grammar, and punctuation are important.

Describing your problem

- Don't just say "it doesn't work".
- Explain how you encountered your problem.
- Explain what you did to try to solve the problem.
 - Otherwise people may give the answer that you have tried already.

Help Others Reproduce your Problem

- <https://stackoverflow.com/help/minimal-reproducible-example>
- Do not just post your entire program.
- Write **minimal code/instructions** that reproduces your problem.
 - Sometimes, when you are writing the code you find the answer by yourself.
 - **Minimal**: Must be the smallest possible that reproduces the problem.
 - But must be readable!
 - **Complete**: Must be enough to reproduce the problem.
 - **Reproducible**: Test the code/instructions yourself to make sure that it reproduces the problem.

Take-home Messages

- Have a general awareness of ethical issues when conducting scientific research.
 - Data fabrication
 - Plagiarism
 - Impact in society
- Explain the key ethical issues related to data.
 - Privacy
 - Security
 - Fairness
 - Disclosure
- Write instructions that can be reproducible.
- Write error messages and reports that can be reproducible.
- Document your work so that someone else can reproduce it.

What's Next

- Friday 8 May: Report submission deadline.
- Week 10 lecture: Towards using scripts for reproducibility.
- Quiz 4 (topics from weeks 8 to 10) will move to week 11 (Wed 20 May, 10am).
